GlobalConnect: Infrastructure in 100% Danish Hands

With GlobalConnect's infrastructure, your company will get the best and most future-proof solution for data traffic, processing and storage that the market has to offer. You will reap the following benefits, thanks to our own physical datacentres, our own nation-wide fibre network as well as a staff of competent employees:

- **Maintain your company's focus on the core business**
- **Avoid costly investments in hardware, maintenance and monitoring**
- **Audit-approved infrastructure through ISAE 3402**
- **Gain access to a virtual datacentre through our own portal**
- **Full network integration with our own Danish datacentres**

GlobalConnect is a Danish company with datacentres totalling 13,000 square metres, located across the country and connected through our own raw fibre network of some 14,000 km. And we are still digging. A raw fibre network means that we can allocate individual fibres to carry only your company's data traffic, at a speed of 400 Gbit per second, so it will seem as though your data never left home.

Our "Infrastructure as a Service" provides further options to outsource the often time-consuming tasks involved in maintenance and monitoring of traffic as well as the current state of all server platforms. We offer fully competent operation and maintenance of everything from network infrastructure, data centres and storage to user interfaces and hypervisors, allowing your internal IT resources to focus on development instead of operations and support.
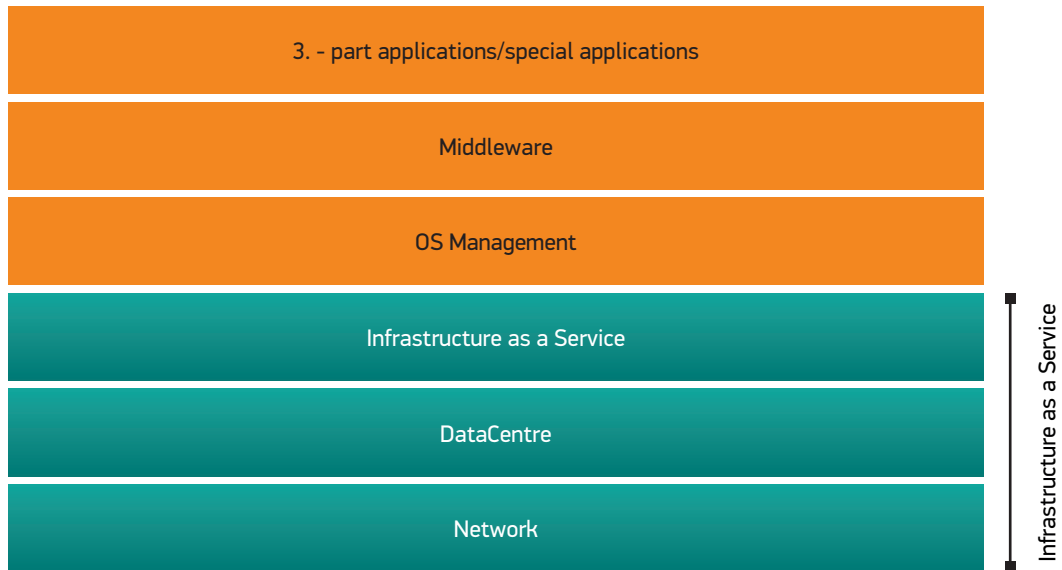

As a supplier of both datacentres and network solutions, GlobalConnect can guarantee that all data transport from your company to the IT infrastructure is fully protected. Our procedures concerning monitoring and maintenance of all systems are consistent and meet the highest standards within IT security, including ISO27001 and ISAE 3402. Similarly, our support departments around the country will be fully available 24/7 should you require immediate assistance.

Our solutions are designed to offer differentiated service level agreements (SLAs), so that the most business-critical servers can benefit from the market's highest guaranteed level, while the less business- critical servers can have lesser SLAs. As an entirely unique service, GlobalConnect can also offer agreements that include guaranteed uptime for both network and computing power, and thus a guaranteed uptime for the entire, total solution. A fully customised product that gives the company security, usability and significant savings within IT operations.
